OUR PRODUCTS

QUARTZ GRIT (1.2 TO 2.5 MM)

DOLOMITE is one of our major sources of concrete so essential to modern society's road and building infrastructure. Crystals of dolomite are common in hydrothermal vein deposits and in sedimentary rocks, where they fill pores in their host rock. It is a sedimentary carbonate rock, which mainly consists of the mineral dolomite also known as dolostone.

The **DOLOMITE** lumps that we provide are of very high magnesium value and very low in iron contents. These dolomite lumps are used in the paint, glass, ceramics frit and detergent industry.
